traackly

PRODUCT MARKETING CASE STUDY

A factory built an order to the wrong spec for weeks. I designed and shipped the fix.

Traackly is a live request board for mid-size manufacturers, from the order desk to the shop floor, built around one rule that stops changes from getting lost.

THE PROBLEM I SAW

For a year I worked in client operations at a mid-size manufacturer in India. Orders went from the order desk to the founder's office for approval, then to logistics and the production floor, over email threads and phone calls.

A railway contractor's order changed after approval. Each edit was approved somewhere in the email chain, but the final spec never reached Production. The floor built to the outdated spec for weeks, causing rework and a late delivery.

Nobody was negligent; the failure was structural. Nothing forced the latest version of a request to travel with it. The team called it a known, recurring problem, so it never got escalated.

> The rule: **every edit made after approval must be acknowledged by whoever works on it next, before that work can continue.**

WHY THIS RULE

- **Not "notify everyone":** notifications are what failed. Emails were sent; nobody had to act.
- **Not re-approval:** that rebuilds the bottleneck and slows every change.
- **Acknowledgment** keeps approvals fast but makes it impossible to build a version you haven't seen.

HOW I'D MEASURE IT

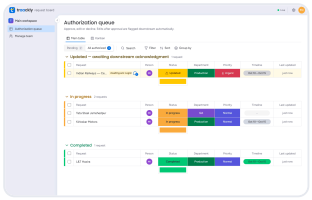

Primary

Share of post-approval edits acknowledged before work continues. The railway order was 0%.

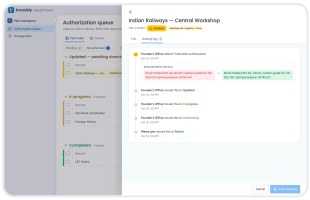

Secondary

Time from edit to acknowledgment, measured under real production load.

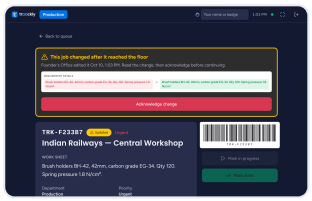

WHAT I SHIPPED

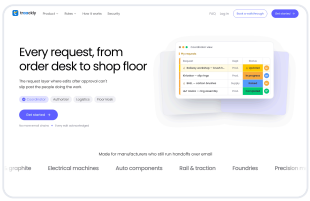

One live board per role, updating in about a second.

Every post-approval edit logged field by field.

Shared floor kiosk: changed jobs flagged, *Mark done* locked.

Homepage and positioning for the target buyer.

Shared kiosks per department reach floor staff who never log in, the gap that desk-first tools like monday.com, Asana and Trello leave open.

WHAT I DID

- Found the problem first-hand and wrote the PRD: personas, metrics, user stories, scope.
- Defined the core rule; directed the product, UX, brand and a 6-minute walkthrough video.
- Built the working software with an AI coding assistant, directing it from my PRD.
- Wrote the positioning, a competitive teardown and a go-to-market plan.

KNOWN VS. STILL TO VALIDATE

Confirmed first-hand	Next to validate
Weeks of building to an outdated spec	Frequency and cost per incident
Team called it a recurring problem	Market size; kiosk usability on a real floor
